The above table gives the correction to be applied to a position line or a fix for the effects of precession and nutation from the mean equinox of 2010.0. Each entry consists of the distance (in bold type) in nautical miles, and the direction (true bearing) in which the position line or fix is to be moved. The table is entered firstly by the year, then by choosing the column nearest the latitude and finally the entry nearest the LHA Υ of observation; no interpolation is necessary, though in extreme cases near the beginning or end of a year (but not the end of 2009 or the beginning of 2010 when the corrections are zero) values midway towards those of the previous or following years may be taken.

*Example.* In 2007 a fix is obtained in latitude N 22° when LHA Υ is 84°. Entering the table with the year 2007, latitude N 20°, and LHA Υ 90° gives **2.0' 274°** which indicates that the fix is to be transferred 2.0 miles in true bearing 274°.

Choose the column appropriate to height, in units of 1,000 feet, and find the range of altitude in which the sextant altitude lies; thus find R<sub>0</sub>. This is the refraction corresponding to the sextant altitude unless conditions are extreme. In that case find f from the lower table corresponding to the range of temperature for the appropriate height, and use the table on the right to find R. Example: at a height of 30,000 feet and temperature (-) 60° C, a celestial body is observed at altitude (-) 2° 36'. R<sub>0</sub> is 50', f is 1.1 and R is 55'. Subtracting this from the sextant altitude gives (-) 3° 31'.
